

New in the range!

Maximum performance and durability.

Crankcase ventilation for commercial vehicles.

We use our expertise as an original equipment manufacturer for a wide range of product groups to now also offer these in the independent aftermarket. Naturally in the usual OE quality and with the best possible service for our customers!

What are crankcase ventilation systems?

Blow-by gases are produced during the compression and combustion of the fuel-air mixture in the engine and contain impurities such as oil droplets, water vapor, soot, and fuel residues. The crankcase ventilation system removes these gases and cleans them with the help of a separator before the cleaned gases are fed to the intake air.

A defective oil separator, which is part of this unit, can cause leaks in the crankcase ventilation system and in the engine seals. Furthermore, oil residue can contaminate the throttle valve, the intake manifold and the turbocharger, which reduces engine power, impairs acceleration and leads to rough idling. In the worst case, engine damage can occur. Regular maintenance and inspection of the system is therefore essential.

Advantages at a glance:

- Extensive expertise thanks to in-house production of oil mist separators
- Product range covers the majority of relevant European car and commercial vehicle models and is constantly being expanded
- High delivery performance for all products
- Patents for the Blue.tron electric disk separator and other passive oil mist separators
- Established brand in the aftermarket
