

Oil filter module for MAN TGE and VW Crafter engines.

Hengst Filtration supplies the Volkswagen Group with an oil filter module that has been specially developed for the Modular Diesel System (MDB) of the 2.0 l TDI engines.

The slim design of the oil filter module enables an optimum combination of oil filtration and oil cooling, even where installation space is limited. The all-plastic module is equipped with an environmentally friendly Energetic® oil filter, a heat exchanger, two pressure switches and a filter bypass valve. The concept ensures service-friendly filter replacement without direct contact with the dirty filter.

A special feature is the patented plastic oil drain plug in the filter cover which, in conjunction with the direct screw connection of the oil cooler, ensures remarkable overall efficiency. These advances were developed in close cooperation with Volkswagen and brought to series production maturity in order to meet the highest standards in the automotive industry.

The Hengst oil filter module is installed in all MDB engines from 77 kW up to a powerful 130 kW (105 hp to 177 hp).
