What are oil filter modules?

Oil filter modules from Hengst are high-tech components with several integrated functions. The main task of the modules with integrated oil filter is to filter the abrasion particles and combustion residues from the oil and thus clean the engine oil. This is particularly important, as only clean and continuous lubrication guarantees the longevity and efficiency of an engine.

The modules are made from materials such as aluminum or special plastics to guarantee the required stability and durability. An integrated pressure relief and non-return valve ensures that the engine is supplied with oil even if the oil filter is clogged.

In addition to the oil filter, other components are included in the module, such as heat exchangers for regulating the temperature of the oil circuit or valves for controlling the cooling circuit. Other functions, such as the integration of coolant pumps and thermostats, are also possible. These multifunctional units save space in the engine compartment and reduce weight.

Our oil filter inserts, which are integrated into the module, also offer an economical and environmentally friendly solution. The Energetic® inserts from Hengst are easily replaceable and often consist of metal-free components.

High-tech in the smallest space.

Your customer benefits at a glance:

- Mounting material, sensors and filter insert included in the scope of delivery
- Service gaskets are already pre-assembled, easy installation of the modules to facilitate assembly
- High delivery performance for all products
- In-house aluminum die casting and plastic injection molding production
- Everything from a single source for the oil circuit
- Previously only available as original equipment, now also available on the independent aftermarket
- Usual Hengst quality

Info

You will always find exactly what you need in the scope of delivery of our oil filter modules. In addition to our filter and the module itself, sensors and gaskets are also included. All in the usual Hengst quality, of course.

Defective gaskets on the original part, cracked housings, defective oil coolers, accident damage and ageing of the modules after long periods of operation - for all these problems, we recommend replacing the complete module for the best possible service.
