

New in the range!

Maximum performance and durability

Crankcase ventilation for commercial vehicles

We use our expertise as an original equipment manufacturer for a wide range of product groups to now also offer these in the independent aftermarket. Naturally in the usual OE quality and with the best possible service for our customers!

FILTRATION

What are crankcase ventilations?

Blow-by gases are produced during the compression and combustion of the fuel-air mixture in the engine and contain impurities such as oil droplets, water vapor, soot and fuel residues. The crankcase ventilation system removes these gases and cleans them through a separator unit.

The cleaned gases are then fed into the intake air. If the separator unit is defective, oil particles can contaminate the throttle valve, the intake manifold and the turbocharger, which reduces engine performance and leads to poor acceleration behavior and rough idling.

Advantages at a glance:

- Extensive expertise thanks to in-house production of oil mist separators
- Product range covers the majority of relevant European car and commercial vehicle models and is constantly being expanded
- High delivery performance for all products
- Patents for the Blue.tron electric disk separator and other passive oil mist separators
- Established brand in the aftermarket

Assortment overview
